

Unit 5

Team Building and Project Management

Unit – V: Team Building & Project Management: - Leadership Styles, Shared Leadership Model, Team Building in Venture, Roles and Responsibilities of team in venture, Explore collaboration tools and techniques, Brainstorming, Introduction to Project Management, Project Life Cycle, Create a Project Plan.

Leadership Style - Introduction

- A **leadership style** refers to a **leader's** characteristic behaviors when directing, motivating, guiding, and managing groups of people.
- Great **leaders** can inspire political movements and social change. They can also motivate others to perform, create, and innovate.
- Leadership style is the manner and approach of providing direction, implementing plans, and motivating people.
- It includes the total pattern of explicit and implicit actions performed by their leader (Newstrom, Davis, 1993).
- The first major study of leadership styles was performed in 1939 by Kurt Lewin who led a group of researchers to identify different styles of leadership.

Leadership Styles

- 🧠 **Authoritarian or Autocratic** - the leader tells his or her employees what to do and how to do it, without getting their advice
- 🧠 **Participative or Democratic** - the leader includes one or more employees in the decision making process, but the leader normally maintains the final decision making authority
- 🧠 **Delegative or Laissez-fair (free-rein)** - the leader allows the employees to make the decisions, however, the leader is still responsible for the decisions that are made

POWER STYLE

EMPHASIS

Shared Leadership

- 💡 **Shared Leadership** is a leadership style that broadly distributes leadership responsibility, such that people within a team and organization lead each other.
- 💡 Under this leadership, the leaders merge themselves with the team, and provide freedom to all team members to contribute while leading the team.
- 💡 It has frequently been compared to horizontal leadership, distributed leadership, and collective leadership.
- 💡 In shared leadership, there is a sense of ownership amongst the team the team members are happy and trust within them and this is the ideal leadership style for the success of startup.

Shared Leadership can be defined by

- A systematic approach of finding and developing organizational leaders
- These leaders take important areas, products and services
- They lead and develop cross-functional teams
- Every team focuses on smaller big part of the organization portfolio.

Example

- Sergey Brin and Larry Page - cofounders of google in 1998
- They have common interests and common ideologies
 - (Don't do evil)
 - (arms and hard liquor ads don't find their way in google)
- Page heads the products division Brin takes care of Technology
- Google today has various other teams, working extensively on the many products they build/services they offer.

Importance of Shared Leadership

- The act of sharing leadership promotes innovative and committed behavior among team members;
- Shared leadership positively transforms the composition of vertical companies, reintegrating teams;
- Individuals at the firm create bonds of interdependence through the exercise of shared leadership, favoring teamwork
- Also, in shared leadership, lead roles are assigned based on experience and expertise of each person.
- The main objective of shared leadership is to take the entire team to achieve a common goal.
- Driving principles are
 - Ownership
 - Trust
 - Alignment to the big picture

Importance of Shared Leadership

- Freedom and the ability to speak out during the execution of shared activities increases levels of satisfaction and company identification among its members;
- Example of positive behavior and the proactivity of shared leadership affects everyone within the company, broadly motivating teams.
- Successful results that are achieved through shared leadership lead to a recognition of the participativ

Importance of Shared Leadership

How shared leadership benefit companies and can partnerships

- In addition to its association with innovation, the growing prevalence of team-based work favors the adoption of shared leadership, working in groups is prevalent in this model.
- Shared leadership and partnerships between leaders bring along with them a number of changes to the workplace and the composition of teams.
- When leaders understand that most employees are just seeking some space and a measure of recognition, it is easy to understand how shared leadership can motivate staff, elevating both team performance and the company's results.

Team Building

- Team building is the process of taking a collection of individuals with different needs, backgrounds and expertise and transforming them by various methods into an integrated, effective work unit.
- The concept of team building becomes critically important as bureaucratic hierarchies decline and horizontally-oriented teams and work units become increasingly important.
- In most cases, team building involves relationships among peers with a wide diversity of expertise.

Major Barriers To Team Development

- Differing Outlooks, Priorities, Interests and Judgments of Team Members
- Role conflicts
- Project Outcomes Not Clear
- Competition Over Team Leadership
- Lack of Team Definition and structure
- Team Personnel Selection
- Credibility of the Project Leader
- Lack of Team Member Commitment

Role of a good team in a venture

- A great Top Team extends the values, vision, mission and plan throughout the company, aligns the company and accelerates its growth.
- A dysfunctional team can tear a company apart and send it down the tubes.
- This team should consist of people who can manage three significant roles: functional, executive, and leadership.
- Team members must be able to combine managing operations, serving on your executive team and helping you fulfill some of your leadership roles and responsibilities.

Role of a good team in a venture

The Evolution of the Top Team

-  An effective Top Team must be able to run the company day to day in order to be able to move out of operations and focus on strategy.
-  Top Team can help create a new and better "big-picture" vision as the company grows. They'll bring a new perspectives and specialized knowledge.
-  Encourage and support them as they grow and develop into their expanded roles and responsibilities.

Role of a good team in a venture

- The team responsible for implementing the company's plan, measuring and evaluating results, and helping each other succeed.
- Hold them accountable for their performance in all three areas detailed above.
- Be explicit and define the expectations of each Top Team member.
- Be clear about which roles and tasks we are retaining and which ones we are delegating to them individually and as a group. Provide direction to them.

Roles and Responsibilities of a team in a venture

- When you assemble your Top Team, each member must be capable of fulfilling all of the following roles and responsibilities:

As the leader of their **functional area**, team members must:

- Manage their functional area(s) and the resources allocated to them.
- Attract and retain great people.
- Communicate effectively so that everyone in their unit understands the company's vision, mission, values, and plan; how their job relates to the plan, and the results expected of them.

Roles and Responsibilities of a team in a venture

As a member of the **Executive Team**, team members must:

- 🧠 Manage the implementation of the company's plan.
- 🧠 Be a role model for innovation, teamwork, and problem-solving.
- 🧠 Help other team members succeed.

As a member of your **Leadership Team**, team members must:

- 🧠 Help you develop the plan for growth.
- 🧠 Protect and build a company culture that supports growth.
- 🧠 Optimize resources to achieve company goals.

Explore collaboration tools and techniques

💡 Tools needed to **collaborate**, i.e. for **two or more people or organizations to work together, towards the accomplishment of an intersection of common goals and objectives by sharing knowledge, learning and building consensus (agreement).**

💡 Tools

- a) Brainstorming
- b) Mind Mapping
- c) Thinking hats method
- d) Nominal Group Technique
- e) Fish-bone diagram

a) Brainstorming

- 💡 **Brainstorming** refers to the practice of generating ideas and putting them down in concrete form on a piece of paper. You can use brainstorming to force your brain to come up with new solutions to problems or ideas about a product.
- 💡 Traditionally, **brainstorming is a group activity, but can also be an individual activity at times.**
- 💡 In brainstorming, efforts are made to find a conclusion to a specific problem by gathering a list of ideas, spontaneously contributed by its members. In addition to generating ideas, brainstorming can help weave connected ideas together to form a whole collaborative idea.
- 💡 Alex F. Osborn employed Brainstorming to generate ideas, and is given the credit for popularizing the term.
- 💡 It is a technique for finding alternatives which can be used at all stages of Problem-solving process.
- 💡 It is entirely a divergent thinking process.

Method - Group Brainstorming

- 💡 **Set the Problem** such that it is precisely defined, not too big, and fits into one question.
- 💡 **Plan the brainstorming session and design memos to be sent to invitees and guests if necessary.** In the memos, the problem is described and sample ideas are suggested, so that invitees think of solutions before they attend the brainstorming session. The details of the session are also mentioned.
- 💡 **From all the invitees, select around 10 participants** comprising of core contributors to the project, guests familiar with the subject of the project/problem and an idea collector, and begin with the brainstorming session to generate ideas.
- 💡 **Create a list of lead questions to be asked** when the creativity in the session decreases at various instances, in order to generate more ideas and take the discussion forward. An example of a lead question is,
 - *“can we combine these ideas?”*
 - *“how about looking at these ideas from a different perspective?”*

Osborn's Rules/Guidelines for Brainstorming

1. Criticism is ruled out:

Negative comments on ideas must be discouraged to allow for free exploration of all ideas.

2. Free wheeling is welcomed:

Freewheeling is encouraged with any ideas welcomed as it is easier to later refine ideas than to make them more unique.

In this context, freewheeling refers to generating seemingly “crazy” or “exaggerated” ideas. This principle states that such ideas should not be censored.

In 1957, advertising executive Alexander Faickney Osborn came up with four rules of brainstorming:

3. Quantity is encouraged

The greater the number of ideas The more likelihood of useful ideas

4. Combining & improving ideas is encouraged

Participants should suggest how the ideas of others could be joined into a still newer ideas to get the best solution.

Advantages of Brainstorming

- Many ideas are produced in a short timeframe
- Enables participants to both contribute individually and gain benefits from the ideas generated by others
- Encourages the generation of “unusual” ideas
- Encourages deeper thinking about particular problems
- Creates an environment that would enhance group activity and teamwork

b) Mind Mapping

- 💡 The key to mind mapping is **to take note of every idea that comes up**. We should not neglect anything, no matter how far-fetched it may seem.
- 💡 **Generate as many ideas as possible**; the more we get, the bigger chance of finding that golden ticket idea.
- 💡 Mind maps capture thoughts, ideas and keywords, we can organize them in a **two-dimensional structure**.
- 💡 The title/main idea is always located in the **center of the map** and thus always clearly visible.
- 💡 Related ideas branch off from the center in all directions, creating a **radiant structure**.
- 💡 Advantages of Mind Mapping -
 - 👄 Improves productivity
 - 👄 Structures information
 - 👄 Finds relationship between variables
 - 👄 Fosters creativity
 - 👄 Improves memory and recall

Project

“A project is a series of activities or tasks or operations directed to accomplishment of a desired objective.”

“A project is a temporary endeavour undertaken to create a "unique" product or service.”

Importance of Project Management

- 💡 It's not always easy to start with your organization. Many loose ends need to be tied, and millions of small tasks that need to be managed at the same time.
- 💡 Lack of experience makes many entrepreneurs scale up operations too quickly - the prime reason that over 70% of new ventures fail to perform successfully.
- 💡 Utilizing the principles of project management is a holistic solution that can give your startup a better chance of commercial success.
- 💡 Project Management is a **detailed methodology for the systematic initiation, tracking, and closing of a project.**

Importance of Project Management

💡 Project Management is -

- A significant factor for business success and helps managers achieve goals with greater clarity.
- Leads to agility and flexibility in operations
- Gives a roadmap and a detailed timeline for team members

The importance of project management

- **Project management** involves systematically planning and implementing activities to ensure project completion on time, within budget and to the required specifications.
- The time element is important in events as they generally can't be put back if a delay occurs.
- Events have significant impact on the economy and have stakeholders demanding accountability.
- Events are multi-faceted, used for promotion, sales, training, increasing the need for a systematic approach.

Principles of Project Management

a) Develop A Long Term Vision

💡 Project managers need to lay down specific goals with timelines, as this will give team members a clear picture of what they need to achieve.

💡 Just setting down a list of goals is not enough - communication is the golden key that can help you get things done better and faster.

💡 Project team members need to be conveyed the long term goals along with the leading corporate strategy so that they are not in the dark.

Principles of Project Management

b) Plan By Breaking Down Milestones

- 💡 step-by-step project plan that breaks down goals into smaller tasks and milestones.
- 💡 Entrepreneurs need to remain flexible and cater to unexpected changes.
- 💡 Make a scheduled plan by breaking down project phases and assigned time deadlines to each step.
- 💡 It will help team members in creating a mental map and keeping track of their progress

Principles of Project Management

c) Manage Structured Execution

- 💡 Some tools that most startups can use to execute projects smoothly include time tracking software, Gantt charts, file sharing applications, and budget management systems.
- 💡 Another aspect that entrepreneurs need to manage well in the execution phase is the distribution of resources.
- 💡 Project managers have to optimize the use of physical, intellectual, and financial resources.
- 💡 Resource allocation should be fair and transparent so that there are no conflicts or clashes between project team members.

Principles of Project Management

💡 D) Constantly Monitor Progress

It is essential to monitor the progress of projects at various time intervals, and check whether all milestones are being achieved according to the initial plan.

💡 Project managers need to track all key performance indicators so that they can immediately identify any underperformers or red flags.

💡 constantly positive and negative feedback to team members is essential.

Principles of Project Management

💡e) Close The Project By Creating Future Resources

- 💡Project managers need to know when to wrap up and close the project once all goals have been attained.
- 💡Complete all payments to vendors, suppliers, and thank clients for a successful collaboration.
- 💡In the case of new ventures, it is important to learn lessons from each success story and create resources that may help in future projects.
- 💡Entrepreneurs need to archive all vital project documents and make a mental note of what worked for their project.
- 💡They may also choose to reflect on their mistakes so that they can be avoided the next time around.

Points to successful project management in an organization

- ✓ Understanding client needs
- ✓ Planning
- ✓ Clear communication
- ✓ Implementing Plan
- ✓ Managing change
- ✓ Evaluation

Project Evaluation Techniques

💡 Gantt Charts

💡 Network Analysis

- PERT
- CPM

a) Gantt Charts

- 💡 A **Gantt chart** is a type of bar chart that illustrates a project schedule, named after its inventor, Henry Gantt (1861-1919), who designed such a chart around the years 1910-1915.
- 💡 Modern Gantt charts also show the dependency relationships between activities and current schedule status.

1-MONTH GANTT CHART TEMPLATE

TODAY

JUNE

1-MONTH GANTT CHART TEMPLATE

a) Gantt Charts - Contd.

- A Gantt chart is a type of **bar chart** that **illustrates a project schedule**.
- This chart lists the tasks to be performed on the vertical axis, and time intervals on the horizontal axis. The width of the horizontal bars in the graph shows the duration of each activity.
- Gantt charts illustrate the start and finish dates of the terminal elements and summary elements of a project. Terminal elements and summary elements constitute the work breakdown structure of the project.
- Modern Gantt charts also show the dependency (i.e., precedence network) relationships between activities.
- Gantt charts can be used to show current schedule status using percent-complete shadings and a vertical "TODAY" line as shown here.

• **Advantages**

- It is easy to understand.
- It gives clarity of dates.
- It enables **time management**.
- It brings efficiency.
- It ensures accountability in terms of timeline.
- It expects coordination among stakeholders in order to deliver things as per Gantt timeline.

b) Network Analysis

- ☐ Network analysis is a system which plans projects both large and small by analyzing the project activities
- ☐ Projects are broken down to individual tasks or activities, which are arranged in logical sequential order
- ☐ A network diagram is constructed which presents the relationship b/w all the activities involved.

According to author - “Network analysis helps to designing, Planning, Coordinating and decision making in order to accomplish the project economically in the minimum available time with the limited available resources.”

Network Analysis refers to a number of techniques for the planning and control of complex projects.

The two most frequently used forms of network planning are:

- 1. Programme Evaluation and Review Technique (PERT)**
- 2. Critical Path Method (CPM)**

PERT	CPM
1. PERT is used for non-repetitive jobs like planning the assembly of the space. 2. it is a probabilistic model. 3. It is event-oriented as the results of analysis are expressed in terms of events or distinct points in time indicative of progress. 4. It is applied mainly for planning and scheduling research programmes. 5. PERT incorporates statistical analysis and thereby determines the probabilities concerning the time by which each activity or entire project would be completed. 6. PERT serves as useful control device as it assists management in controlling a project by calling attention to such delays	1. CPM is used for repetitive job like building a house 2. It is a deterministic model. 3. It is activity-oriented as the result or calculations are considered in terms of activities or operations of the project. 4. It is applied mainly for construction and business problems. 5. CPM does not incorporate statistical analysis in determining time estimates, because time is precise and known. 6. It is difficult to use CPM as a control device for the simple reason that one must repeat the entire evaluation of the project each time the changes are introduced into the network.

Project Life Cycle

💡 A project life cycle is the sequence of phases that a project goes through from its initiation to its closure.

💡 The standard framework of most projects consists of the same generic lifecycle structure, consisting of following phases:

1.The Initiation Phase:

Starting of the project

2.The Planning Phase:

Organizing and Preparing

3.The Execution Phase:

Carrying out the project

4.The Termination Phase:

Closing the project

©Guru99.com

Project Life Cycle

Initiation Phase

The initiation phase aims to define and authorize the project. The project manager takes the given information and creates a Project Charter. The Project Charter authorizes the project and documents the primary requirements for the project. It includes information such as:

- Project's purpose, vision, and mission
- Measurable objectives and success criteria
- Elaborated project description, conditions, and risks
- Name and authority of the project sponsor
- Concerned stakeholders

Project Life Cycle

Planning Phase

💡 The purpose of this phase is to lay down a detailed strategy of how the project has to be performed and how to make it a success.

💡 Project Planning consists of two parts:

- Strategic Planning
- Implementation Planning

💡 In strategic planning, the overall approach to the project is developed. In implementation planning, the ways to apply those decisions are sought.

Project Life Cycle

Execution Phase

In this phase, the decisions and activities defined during the planning phase are implemented. During this phase, the project manager has to supervise the project and prevent any errors from taking place. This process is also termed as **monitoring and controlling**. After satisfaction from the customer, sponsor, and stakeholder's end, he takes the process to the next step.

Termination Phase

This is the last phase of any project, and it marks the official closure of the project.

Characteristics of the Project Life Cycle

- At the start, cost and staffing levels are low and reach a peak when the work is in progress. It again starts to drop rapidly as the project begins to halt.
- The typical cost and staffing curve does not apply to all projects. Considerable expenses are required to secure essential resources early in its life cycle.
- Risk and uncertainty are at their peak at the beginning of the project. These factors drop over the lifecycle of the project as decisions are reached, and deliverables are accepted.
- The ability to affect the final product of the project without impacting the cost drastically is highest at the start of the project and decreases as the project advances towards completion. It is clear from the figure 2 that the cost of making new changes and rectifying errors increases as the project approaches completion.

The End
